Signed Numbers Representation

- Three main different ways
- Sign and magnitude
- r-1's complement
- r's complement

Signed binary number

Positive numbers can be defined with Sign bit 0

- Ex. In 8-bit representation of +9 = 00001001
- Negative numbers can be represented in three different ways:
 - Signed magnitude: -9 = 10001001
 - Signed 1's complement: -9 = 11110110
 - Signed 2's complement: -9 = 11110111

+0 has different code from -0

• Undesired aspect in signed binary and 1 s complement method:

representation of 0s:

Radix Complements (r-1's complement)

- r-1's Complements:
 - Diminished Radix (r-1)'s Complement
 - (r-1)'s complement of a number N with n digits is $(r^n-1) N$.

Ex.:9's complement of 346 is 999-346=653 (103 -1= 999)

 1's complement of a binary number can be determined as just replacing 1's with 0's and vice-versa..

Radix Complements (r's complement)

- Radix complement:
 - r's complement of a number N with n digits is $r^n N = (r^n 1) N + 1$.

Ex. 10's complement of 346 is = 654 (653+1) 2's complement of 1011= 0101

NB: complement of Complement of N is N $r^n - (r^n - N) = N$
